

Resistance table

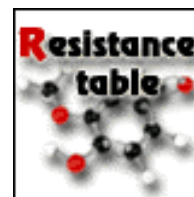

Developed in cooperation with
Christian Berner AB

Resistance table is a program for people who work with chemicals and want to know which materials that are resistant to a selected chemical.

You can also add own chemicals and material and relate these with each other.

Resistance table allows you to filter the materials you work with so you don't have to see other materials. The resistance table that is shown can easily be copied and thus be pasted into any program, e.g. Word, Excel, etc.

With an easy but powerful search function you can easily find the sought chemical. Then the material that are tested with that chemical is shown.

With the filter function you can select what you want to see. This goes for materials, values, concentrations and temperatures. The chemical names is available in 3 languages: English, Swedish and German.

With Resistance table you save both time and money. Quickly you will find the values. A lot of data are already in the database that comes with the program.

Try Resistance table in peace and quiet to see how easy it is to use and what it can do for you.
